Attention: Mr. David Hickens

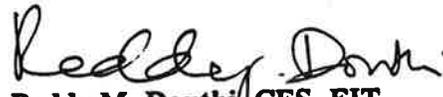

Subject: Environmental Impact Assessment  
Neutral Buoyancy Laboratory  
Clear Lake, Texas  
Purchase Order T-6585-T  
GTI Job No. 94026

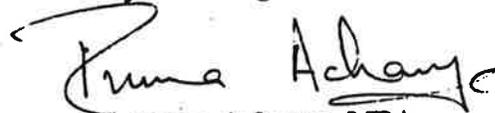

Dear Mr. Hickens:

Ground Technology, Inc. is pleased to submit this report of Environmental Impact Assessment for the construction of the NBL at the Sonny Carter Training Facility located in Clear Lake, Texas. The work was authorized by C. Gemar on March 21, 1995.

We have enjoyed working with you on this project and look forward to a continuing business relationship. If you have any questions or comments concerning this report, please contact us.

Sincerely,  
GROUND TECHNOLOGY, INC.

  
Reddy M. Donthi, CES, EIT  
Project Manager

  
Dr. Ruma Acharya, MBA  
President

1     **1.0 EXECUTIVE SUMMARY**

2     The proposed action consists of construction of the Neutral Buoyancy laboratory (NBL)  
3     at the Sonny Carter Training Facility (SCTF) in Houston, Texas. The NBL is comprised  
4     of a large pool containing approximately 6 million gallons of water and associated  
5     equipment as well as additional space required to accommodate the test personnel and  
6     equipment. This facility will provide the required capacity for simulation of Space  
7     Transportation System (STS) and space station associated extravehicular activity (EVA)  
8     tasks. It is proposed to construct the NBL within the existing Assembly and Testing  
9     Building (ATB) located at 13000 Space Center Blvd. This site is currently under  
10    lease/purchase arrangement between the National Aeronautics and Space Administration  
11    (NASA) and its current owner, the McDonnell Douglas Corporation.

12  
13    Two alternatives to the proposed action have been considered . One proposed action  
14    is construction of a completely new facility, including the building(s), at the Johnson  
15    Space Center (JSC) which would require more construction activities and longer  
16    completion period associated with higher cost. The other, is a no action alternative  
17    which would force NASA to continue training activities at scattered facilities which are  
18    too small to accommodate larger structural assemblies of the STS and the space station.

19  
20    The potential cultural, socio-economic, biological, and ecological impacts anticipated  
21    from the construction and operation of the proposed NBL have been assessed and  
22    evaluated. Evaluation of each one of these issues did not reveal any significant impacts  
23    due to the proposed action hence a finding of no significant impact (FONSI) is  
24    determined. Cultural impacts were evaluated from the standpoint of land use, wild and  
25    scenic rivers, historical sites and cultural resources. In the case of land use a FONSI  
26    has been made as the only anticipated change will be enhanced utilization of an existing  
27    building at the site. Also, no significant increase of the number of employees to operate  
28    the facility is anticipated. No evidence of historical sites, paleontological resources,  
29    artifacts, fossils, prehistoric settlement, wild and scenic rivers were observed at or in the  
30    vicinity of the site.

31  
32    Socio-economic impacts from the standpoint of economic, population growth, and  
33    constructed facilities and activities again presented no significant impact to the

1 surrounding areas and human environment. The only significant impact would be on  
2 NASA as this action will increase confidence that NBL will be constructed on schedule  
3 and important astronaut training can begin sooner. Also, additional savings from the  
4 early shutdown of JSC's existing underwater facility can be realized.

5  
6 Evaluation of the biological and ecological impacts indicated no impact on biotic  
7 resources, wetlands or endangered species as the site is already developed and does not  
8 contain any critical habitats of plant and animal communities or wetlands. Liquid wastes  
9 consisting of backwash from the pool filtration system will be introduced into SCTF's  
10 sanitary sewer system. The anticipated waste water flow will not pose any problem from  
11 the standpoint of handling and treatment. Any potential contamination associated with  
12 the waste water will be mitigated by treating the water at Clear Lake Water Authority's  
13 waste water treatment facility. Temporary and permanent dewatering system flow will  
14 be discharged into the storm water drainage system running along the east boundary of  
15 the subject site. No impact is anticipated from this action as no detectable levels of  
16 contaminants were found in the groundwater.

17  
18 The proposed action was found to not have any adverse effects on the air emissions  
19 dispersion pattern near the proposed facility. The boiler for the proposed action will  
20 use natural gas as fuel and has a heat input rate of less than 25 million BTU's per hour.  
21 This boiler is therefore exempted from permitting requirements by the TNRCC since  
22 such equipment will not make a significant contribution to atmospheric pollution. Also,  
23 the normal operations of the NBL was found to generate relatively low noise levels as  
24 compared to average noise levels at the subject site generated by Ellington Field flight  
25 operations. Existing Ellington Field operations will have the dominant impact on noise  
26 levels in the site vicinity, consequently, the proposed facility will not increase noise levels  
27 considerably at the subject and the surrounding areas.

28  
29 During the construction period of approximately one year and six months, increased  
30 vehicle traffic will be experienced along the Clear Lake City Boulevard. An increase in  
31 noise caused by the construction traffic will be the primary negative impact on the  
32 community. However, the anticipated impact on the nearby residential areas should be  
33 short-term and minimal. These short-term construction effects are offset by the relative

1

long-term gains of providing a much needed facility for JSC programs to accommodate

2

larger structural assemblies required for the development of a manned space station.

PURPOSE AND NEED

2.1 Project Setting and Statement of Proposed Action

The proposed project consists of construction of Neutral Buoyancy Laboratory (NBL) at the Sonny Carter Training Facility (SCTF) in Houston, Texas. This facility is to provide the required capacity for simulation of Space Transportation System (STS) and space station associated extravehicular activity (EVA) tasks. The NBL is comprised of a large pool containing approximately 6 million gallons of water and associated equipment as well as additional space required to accommodate the test personnel and equipment. The NBL will be constructed in the existing high-bay ATB at the SCTF. This property is currently under lease/purchase arrangement between the NASA and the McDonnell Douglas Corporation.

2.2 Purpose and Need

EVA training under simulated zero-gravity conditions has been successfully developed and performed utilizing neutral buoyancy techniques in large water tank facilities. Such techniques allow space-suited astronauts to practice space-related EVA tasks on the ground. The successful completion of past space mission EVA tasks is directly attributable to zero-g simulations by the water tank operations and the use of full-scale mockups of space hardware.

Current demands of the STS in-orbit EVA operations and future needs of the space station program cannot be met by existing water tank facilities which have been sized for the past program spacecraft size. These facilities are too small to accommodate the larger structural assemblies of the current STS, space station, and future space program requirements.

The initial space station assembly operations rely heavily on the EVA's being successful. Because these operations are critical to the success of the space station mission, the EVA training facility needs to be operational well in advance of the first launch for astronaut crew procedures development and training.

Once the NBL is available, the current JSC neutral buoyancy simulation facility, the WETF, will be closed. Due to its close proximity to existing buildings and disruption of ongoing training programs, expansion of the WETF is not practical.

1 3.0

2 3.1 Proposed Action Description

3 NASA proposes to construct the NBL at the SCTF currently under lease/purchase  
4 agreement with McDonnell Douglas Corporation. The NBL is to be built within the  
5 existing ATB located at 13000 Space Center Blvd. by McDonnell Douglas.

6  
7 The NBL will consist of a rectangular pool 101-feet wide by 202-feet long and 40-feet  
8 deep containing approximately 6 million gallons of water, and associated piping and  
9 equipment as well as additional space required to accommodate test personnel and  
10 equipment. The bottom of the pool slab will be located approximately 26 feet below the  
11 building floor level.

12  
13 It is proposed to construct the pool with a six feet thick concrete foundation mat and  
14 walls which are 5 feet thick at their base and 2-1/2 feet thick above grade. The  
15 foundation mat will be placed on a waterproofing system, over a mud slab, with a  
16 topping slab to improve quality control of the finished slab. It is designed to resist  
17 forces developed under both full and empty conditions of the pool. Upper pool walls  
18 are thickened at the corners to account for local stresses. Walls below grade are placed  
19 against a drainage/waterproofing system. Walls are designed to cantilever approximately  
20 40 feet from the mat foundation to resist hydrostatic pressure exerted by the water and  
21 for approximately 20 feet from the mat foundation to resist external soil pressures  
22 developed during construction or emptying of the pool. Pool walls will partially support  
23 the Deck Level and Mezzanine Two Level deck slabs.

24  
25 Excavation of the pool foundation will result in removal of approximately 23,000 cu.  
26 yd. of soil to be disposed off site. In addition, about 24,000 sq. ft. of concrete building  
27 slab will have to be broken up and removed. Since the excavation slopes must be  
28 vertical, braced excavation is required. A bracing system consisting of H-piles and wood  
29 lagging with hollow stem augured tie-backs has been proposed.

30  
31 A ground water control system is necessary to effect safe pool excavation and  
32 construction. A temporary dewatering system consisting of 54 shallow and 6 deep wells  
33 producing an average of approximately 120 gpm of water for a period of about one year

1 has been proposed. In addition, a permanent dewatering system producing an average  
2 of 10 gpm over the life of the facility will be installed. When the pool is analyzed under  
3 empty conditions the combined effects of lateral water pressure from the grade level to  
4 the foundation base and the uplift pressure from deep sand are very severe. Without  
5 provisions for a permanent perimeter and under floor drainage system, damage to the  
6 pool's structure may result.

7  
8 To provide an optimal training environment a high level of pool water clarity will have  
9 to be continuously maintained. Water treatment will consist of filtration, chlorination  
10 with sodium hypochlorite, algae control with algaecide, and pH maintenance with  
11 muriatic acid. Pool water will be recirculated once every 12 hours. A vacuum system  
12 and surface skimmer will be provided to remove sediment and dirt accumulations.  
13 Constant water temperature will be maintained at about 83°F with a natural gas fired  
14 boiler.

### 15 16 **3.2 No Action Alternative**

17 The no action alternative would force NASA to continue training activities at the JSC  
18 WETF as well as at other scattered NASA and private contractor facilities. These  
19 facilities are too small to accommodate the larger structural assemblies of the STS and  
20 space station, and severely hamper the ability to fully test this hardware. Only partial  
21 and incomplete testing could be accomplished at these facilities.

22 As a result, the critical dependence of initial space station assembly and operational  
23 success on orbital EVA operations could be compromised. In addition, current STS  
24 program requirements cannot be met due to pool size limitations. Coordination of  
25 training and mockup development would also be very difficult since mockups would be  
26 dispersed to the different training locations rather than being readily available at a single  
27 location. An additional consideration is the enhanced ability to coordinate training  
28 activities by having a single facility located where the astronauts are based.

### 29 30 **3.3 Summary of Other Proposed Alternatives**

31 Certain issues related to NBL design and siting potentially have some environmental  
32 consequences. These issues can be resolved by evaluating and rating the various relative  
33 merits of each alternative on the basis of environmental considerations.

1           **3.3.1 Site Location**

2           The alternative of constructing the NBL facility on JSC property has been  
3           studied and thoroughly evaluated previously. The environmental consequences  
4           of the JSC siting would marginally exceed those for SCTF due to some wetlands  
5           impact and the somewhat greater amount of excavation and construction  
6           activities required. Since the facility would have to be constructed from the  
7           ground up, its cost will be higher and completion schedule lengthened with  
8           potential impact on space mission schedules.

9  
10           Upgrading of the existing WETF at JSC is not practical or economically feasible,  
11           due to inadequate expansion space. Furthermore, it would require shutdown of  
12           current training operations with resulting adverse impact on current and planned  
13           STS missions.

14  
15           Geotechnical conditions at the JSC site are quite similar to the SCTF site from  
16           the standpoint of soil stratigraphy and groundwater conditions.

17  
18           **3.3.2 Pool Structure Design Alternatives**

19           Pool struction design is the main consideration for the NBL facility. Since the  
20           construction will be occurring within an existing building, the objective is to  
21           evaluate pool configurations that would minimize the potential impact on the  
22           existing building foundations. Due to space constraints and the existing building  
23           foundation configuration, the pool design as described in Sect. 3.1 is the only  
24           viable alternative.

25  
26           **3.3.3 Pool Foundation Depth Alternatives**

27           A 40 feet deep pool is required to accommodate current and future NASA  
28           training and development needs. The alternatives range from constructing the  
29           pool above ground to placing it completely below grade.

30  
31           **3.3.3.1 Foundation at Grade.** Placement of the pool fully above ground  
32           would require more complex design and construction with higher  
33           attendant costs than the below ground option. This would still hold true  
34           even though a minimal amount of excavation and no dewatering system  
35           would be required. Furthermore, the height of the existing building may

1 not be sufficient to provide required clearances for NBL operations.  
2 Also, access to the pool would be more complicated and operations more time  
3 consuming. This alternative was eliminated from consideration early in the  
4 preliminary design phase.

5  
6 **3.3.3.2 Pool Bottom at 40 Feet Depth.** Construction of the pool  
7 completely below grade would require a considerable amount of  
8 additional soil removal with the attendant problems of soil disposal and  
9 excavation bracing. The excavation will penetrate deeper below the  
10 static water table and require larger temporary as well as active  
11 permanent dewatering systems than pool construction at shallower  
12 depths.

13  
14 **3.3.3.3 Pool Bottom at 20 Feet Depth.** At this depth the top of the pool  
15 would be 20 feet above the existing building slab. This represents a  
16 reasonable balance between the problems inherent with deeper  
17 excavation and additional stiffening and wall thickness requirement  
18 should the pool be constructed at higher elevated.

19  
20 At this depth there is still some concern about the hydrostatic forces due  
21 to the static water table and uplift pressures from the deeper sand  
22 aquifer. Consequently, the Geotechnical Consultant has recommended  
23 a modest passive permanent drainage system for groundwater control  
24 purposes.

25  
26 **3.3.4. Dewatering System Requirements Alternatives**

27 **3.3.4.1 Temporary Dewatering.** A temporary dewatering system will be  
28 necessary for site construction of the NBL pool. The static water table  
29 would have to be lowered below the depth of the excavation as well as  
30 lowering of the pressure in the sand aquifer affected.

31  
32 It is estimated that the temporary dewatering system will be in operation  
33 for approximately one year, will result in average water discharge of  
34 approximately 120 gpm.

31  
32  
33

**3.3.4.2 Permanent Dewatering System.** An under slab drainage system will reduce external pressures, improve effectiveness of waterproofing, and reduce buoyancy of the pool when empty. This system is designed to dewater at a rate of approximately 10 gpm.

**3.3.5. Disposal of Excavated Soil Alternatives**

Final disposition of the excavated soil, so as not to produce harm to public health or adverse effects to the environment, will be resolved by adherence to appropriate local, State and Federal rules, ordinances and regulations governing disposal of such materials. Current plans call for the excavated soil to be disposed at the Ellington Field area. Ellington Field, which is controlled by the City of Houston Aviation Department, is a fenced, controlled area with limited access to the general public. The McDonnell Douglas Corporation has obtained permission from the City of Houston to dispose the excavated soil at the Ellington Field. A gate with a roadway leading directly to the Ellington Field is present at the back of the SCTF property, and will be utilized to haul the excavated material. An alternative would be to haul the soil to a waste dump facility which would require additional transportation associated with higher cost.

**4.0 ENVIRONMENTAL IMPACTS OF PROPOSED ACTION**

**4.1 Proposed Action**

The potential Cultural, Socio Economic as well as Biological and Ecological impacts anticipated from the operation of the proposed NBL are discussed below.

**4.1.1 Cultural Impacts**

**4.1.1.1 Land Use.** The NBL is to be located at the SCTF. The SCTF consists of approximately 251,600 gross square feet; of which, 101,800 gross square feet is occupied by the ATB; 98,200 gross square feet by the Light Manufacturing Facility (LMF); and approximately 51,600 gross square feet by Avionics Development Facility (ADF). The SCTF is developed and operated by a private contractor. The NBL is planned to be constructed in the ATB, which is a high bay steel-framed structure with metal siding. The SCTF is surrounded by Ellington Field to the

1 north and west, and by residential areas to the south and east.

2  
3 There should not be any adverse effect on the land use of adjacent  
4 properties since the only anticipated change will be the enhanced  
5 utilization of the specific building (ATB) in the proposed action. No  
6 new developments or changes to land use outside the STCF are  
7 anticipated as no significant increase in the number of employees over  
8 and above the present employment level will be required for the  
9 proposed NBL operations.

10  
11 **4.1.1.2 Wild and Scenic Rivers.** Wild and Scenic Rivers are those  
12 designated or proposed under the Wild and Scenic Rivers Act, including  
13 Study Rivers. There are no official scenic or wild waterways on or  
14 adjacent to the subject property.

15  
16 **4.1.1.3 Historical Sites.** No landmark notifications such as plaques,  
17 markers or ground plates were observed at or near the site. There are  
18 no historic buildings or structures present.

19  
20 **4.1.1.4 Cultural Resources.** The subject site is fully developed with  
21 buildings and paved areas. No evidence of standing historic structures,  
22 paleontological resources, artifacts, fossils or pre-historic settlements  
23 were observed on the site. The National Natural Landmark Program  
24 (NNLP) under authority of the Historic Sites Act, identifies and  
25 encourages the preservation of the full range of geological and ecological  
26 features that are determined to represent nationally significant examples  
27 of the nation's natural heritage. The subject and adjacent properties are  
28 not listed in the National Registry of Natural Landmarks.

29  
30 **4.1.2 Socio Economic Impacts**

31 **4.1.2.1 Economic.** Development of the proposed NBL will provide the  
32 capacity for simulation of larger structural assemblies of the STS, space  
33 station, and future space program missions, which can not be achieved

1 within the capacity of the present facility. This action will increase  
2 confidence that the NBL will be constructed on schedule and that  
3 important training can begin sooner. Also, additional savings from early  
4 shutdown of JSC's existing underwater facility can be realized.

5 The economy of the Clear Lake City is supported by the growth of  
6 aerospace industry, and petrochemical, tourism, and recreation  
7 industries. For the duration of construction of approximately two years,  
8 the contractor work force will vary from 20 to 100 people averaging 30  
9 to 40 people on the site at a given time. For the long term no  
10 significant increase in the current work force is expected.  
11

12 **4.1.2.2 Population.** Vicinity of Ellington Field is among the fastest  
13 growing areas in the Southwest Houston area. The proposed NBL  
14 construction will not result in any substantial changes to the population  
15 within the Ellington Field area, since the operation of NBL will not  
16 require a significant increase to the current workforce.  
17

18 **4.1.2.3 Constructed Facilities and Activities.** The subject site was  
19 undeveloped and has been primarily used for farming/grazing operations  
20 until 1990. During the past 5 years the site has been developed by a  
21 private contractor with 149,802 sq. ft. LMF and ADF buildings, 101,777  
22 sq. ft. ATB building, and other paved areas. Currently, the SCTF facility  
23 is operated by the McDonnell-Douglas Corporation who provides  
24 engineering support for the space station program.  
25

26 Ellington Field is located just to the west of the property. It was  
27 established during World War I as a U.S. aviation training facility.  
28 Presently, the majority of the field is owned by the City of Houston  
29 along with several smaller parcels owned by government agencies which  
30 includes NASA. The airport serves the Texas Air National Guard, the  
31 Coast Guard, NASA, general aviation, and commercial air lines.  
32

1                   **4.1.3 Biological and Ecological Impacts**

2                   **4.1.3.1 Biotic Resources.** The private development at the subject site  
3 has removed native plants and replaced these with buildings and paved  
4 areas. No natural or unique plant communities are present at the  
5 subject site.

6                   **4.1.3.2 Endangered Species.** According to the U.S. Fish and Wildlife  
7 Service and the Texas Parks and Wild Life Department, no threatened  
8 or endangered species exists on Ellington Field, and no critical habitat  
9 for these species exist there. The threatened and endangered birds that  
10 may visit Ellington Field include the following: bald eagle (Haliaeetus  
11 leucocephalus), Attwater's Prairie-Chicken (Tympanuchus Cupido  
12 attwari), Houston Machaeranthera (Machaeranthera aurea), Coastal  
13 Grayfeather (Liatris bracteata), and artic peregrine falcon (Falco  
14 Peragrinus trundries). None of these species were observed during field  
15 visits and no evidence of their presence has been discovered at the  
16 subject site. The subject site does not contain critical habitat for  
17 threatened or endangered species, therefore, the development of the  
18 proposed NBL should not affect any of these species.  
19

20  
21                   Because of the previous indications of elevated levels of lead and  
22 mercury in the groundwater, Griffin Dewatering Corporation had  
23 collected groundwater samples from the two existing monitoring wells  
24 located within the area to be dewatered. These laboratory test results  
25 indicated that lead and mercury levels are below the detectable limits of  
26 the test method and thus, currently, there are no indications of  
27 groundwater contamination. Griffin Dewatering Corporation has been  
28 contracted by the current owner of the property to install and operate  
29 the temporary dewatering system at the NBL construction site. The  
30 current property owner is responsible for ensuring that any potential  
31 environmental impacts due to construction site dewatering are mitigated  
32 by adherence to applicable local, State and Federal rules, ordinances,  
33 and regulations.

1 **4.1.3.3 Water Resources**

2 **Waste water:** The proposed facility will have an effect on SCTF's  
3 sanitary sewer system. Liquid wastes consisting of backwash from the  
4 filtration system, skimmer flow, and vacuum system flow will be collected  
5 into a 34,000 gallon wastewater holding tank. The NBL waste water  
6 flow will be approximately 10,000 gallons per day. The wastewater  
7 collected in the holding tank will flow by gravity into the SCTF's sanitary  
8 sewer system. The Clear Lake Water Authority indicated they would not  
9 have problems with the handling and treatment of the anticipated waste  
10 water flow, hence any contamination potential will be mitigated by  
11 treating the water at the Clear Lake Water Authority's wastewater  
12 treatment facilities.

13  
14 **Groundwater:** Three piezometers were installed on the site in  
15 December, 1989, by Woodward-Clyde Consultants at the direction of  
16 a private site developer. The Woodward-Clyde Consultant's report issued  
17 in January, 1990, indicated that, in some of the ground water samples  
18 lead and mercury were found at concentrations above Primary Drinking  
19 Water Standards Maximum Contaminant Levels (MCL's).

20  
21 **4.1.3.4 Wetlands.** The subject site is developed and does not contain  
22 any jurisdictional wetlands.

23  
24 **4.1.3.5 Air.** The site is located in a warm, subtropical climate with  
25 characteristically hot summers and mild winters. Warm tropical winds  
26 from the Gulf of Mexico control the climate during spring, summer, and  
27 fall. Winds in the area are predominantly from the south and southeast.  
28 The proposed action will not have any adverse effect on the air  
29 emissions dispersion pattern near the proposed facility.

30  
31 The stationary and mobile sources of air pollutants at the subject site  
32 include aircraft operations at Ellington Field and automobile emissions.

1 Paint spray operations at SCTF facility are controlled under Standard  
2 Exemption from the TNRCC to the current owner of the site.

3  
4 Air quality in Harris County, including the subject site area, often has  
5 more ozone than the national standards. As such, Harris County, in  
6 which the subject site is located, is in attainment for all the criteria  
7 pollutants except ozone.

8  
9 The boiler for the proposed action will use natural gas as fuel and has  
10 a heat input rate of less than the standard exemption limit of 25 million  
11 BTU's per hour. This type of boiler is listed in the Standard Exemption  
12 list, dated January 16, 1993, and is exempt from the requirements of  
13 TCAA 382.0518, since such equipment will not make a significant  
14 contribution to the atmospheric pollution.

15  
16 **4.1.3.6 Noise.** The noise generated by the Ellington Field causes  
17 significant noise impact to the nearby community. Aircraft operations  
18 at the Ellington Field generate an average noise levels of 70dB(A) at the  
19 subject site.

20  
21 Normal operation of the NBL will generate relatively low noise levels  
22 when compared to Ellington Field flight operations, which will have the  
23 dominant impact on noise levels in the site vicinity. Consequently, the  
24 proposed facility will not increase the noise level at either the subject  
25 site or the surrounding areas. Most of the land immediately surrounding  
26 the site is undeveloped with no sensitive noise receptors. During the  
27 construction, a significant amount of heavy equipments and trucks will  
28 be utilized and will provide an increased noise level in the general  
29 vicinity of the site, the closest sensitive receptor being a residential  
30 subdivision to the east.

31  
32 **4.1.3.7 Spill Control and Counter Measures.** All current operations at  
33 the SCTF are properly permitted by the current owner as required by

1 the City of Houston and Texas Natural Resources Conservation  
2 Commission (TNRCC). The hazardous materials procurement and  
3 hazardous waste disposal is tracked to assure balance.  
4

5 All the hazardous material and hazardous waste required for pool  
6 operations conducted by NASA will be stored in DOT certified  
7 containers and chemical storage buildings will have adequate secondary  
8 containment to prevent a release or spills. The chemicals used for water  
9 treatment will be stored in a chemical storage building where the  
10 potential for a release or spill will be very minimal.  
11

#### 12 **4.2 No Action Alternative**

13 The potential socio-economic and ecological impacts of the no action alternative are  
14 identified and discussed below.  
15

##### 16 **4.2.1 Socio Economic Impacts**

17 The primary impact of the no action alternative would be economic. If the NBL  
18 is not built, the additional costs of conducting testing in scattered facilities would  
19 have to be borne by NASA, as well as added risks and uncertainty associated  
20 with the space-operations that have not been completely tested with full scale  
21 hardware mock ups. This may require transferring parts of the space training  
22 program and personnel out of JSC which could negatively affect economic  
23 development of the Clear Lake area.  
24

##### 25 **4.2.2 Ecological Impacts**

26 The ecological impact of no action alternative is no change to the current  
27 ecological status of the property. It is possible that the property might be sold  
28 or converted to other uses in the future with greater overall ecological impact  
29 than the proposed NBL facility. However, no discharges from the groundwater  
30 control systems will occur if the pool will not be constructed.

1 will be about 120 gpm. This flow will be discharged to a storm water drainage  
2 ditch running north of the property boundary. Although, currently, there are no  
3 indications of any groundwater contamination at the site, the current property  
4 owner and his dewatering contractor are responsible for ensuring that the  
5 potential environmental impacts due to the site dewatering are mitigated by the  
6 adherence to applicable rules and regulations. It is anticipated that 10 gpm flow  
7 from the permanent groundwater control system will also be discharged to the  
8 same storm water drainage ditch.

9  
10 **5.1.3.2 Air.** Air emission effects during the construction should be minimal and  
11 will not violate any national or state standards. Carbon monoxide (CO) will be  
12 produced by the construction equipments and vehicles. Some dust might be  
13 generated during transportation of the excavated soil and dumping at the  
14 disposal site. All movement of the excavated material will occur within fenced  
15 and controlled access areas. Any fugitive particulate matter emissions due to  
16 this operation will not have any impact outside these areas. The natural gas  
17 fired boiler for heating the pool water will not require any air pollution controls  
18 and is exempt from the TNRCC requirements.

19  
20 **5.1.3.3 Noise.** Most of the noise will be generated by the equipments during the  
21 construction phase of the project. Noise due to the excavation equipments  
22 should be contained within the ATB. Trucks travelling to and from the  
23 construction site will be the most significant source of noise that could impact  
24 the surrounding areas. It should be noted that, most likely, the noise levels  
25 associated with the construction and the operation of the NBL facility will be  
26 exceeded by the flight.

## 27 28 **5.2 No Action Impacts**

29 The environmental effect of the no action alternative is that none of the above-listed  
30 environmental impacts will occur and the site might be utilized for some other  
31 commercial or industrial activity. The impact on the area will be primarily economic as  
32 the local construction firms and businesses will not realize some added revenues from  
33 the NBL construction activities.

1 6.0 MITIGATIVE/ADMINISTRATIVE MEASURES

2 6.1 Site Dewatering System

3 During the Phase II environmental site assessment, previously performed for the private  
4 site owner in 1990, low to moderately elevated levels of lead and mercury were found  
5 in the groundwater samples. Subsequently, a recent investigation was conducted by the  
6 private contractor by collecting samples from on-site monitoring wells and analyzing for  
7 lead and mercury levels. The results revealed lead and mercury levels to be below the  
8 detection limit of the test method and indicated that there is no groundwater  
9 contamination. However, the current property owner and his dewatering contractor are  
10 be responsible for ensuring that any potential environmental impacts due to the  
11 discharge of dewatering system flow to the storm water drainage ditch are mitigated by  
12 adhering to the applicable rules and regulations.

13  
14 6.2 Traffic

15 A significant amount of additional traffic will be generated during the construction  
16 phase of the project, which may require some form of traffic control. It is anticipated  
17 that this will require the staggering of heavy equipment movements and deliveries of  
18 large quantities of construction materials so as to avoid the peak traffic load periods.  
19 The contractor(s) are also required to maintain clean and passable streets in the  
20 construction site vicinity as mandated by the standard construction practices.

21  
22 6.3 Air

23 Because SCTF is located in a nonattainment area for ozone, the State Implementation  
24 Plan will have to be revised to include an Employee Trip Reduction (ETR) Plan  
25 requirement for employers of 100 people or more. If the construction contractor  
26 employs 100 or more people, an ETR Plan will be required.

27  
28 6.4 Concrete Waste Management

29 A concrete management plan should be implemented to handle the rinse-water from  
30 cleaning of the interior of the concrete trucks. This plan will prevent contaminants from  
31 reaching the local storm water drainage system.

**NATIONAL AERONAUTICS AND SPACE ADMINISTRATION****NOTICE 95-JSC-SCTC NBL**

**National Environmental Policy Act; Finding of No Significant Impact; Neutral Buoyancy Laboratory (NBL) construction within the Assembly and Testing Building (ATB)**

**AGENCY:** NASA

**ACTION:** Finding of No Significant Impact

**SUMMARY:** Pursuant to the National Environmental Policy Act of 1969, as amended (NEPA) 42 U.S.C. 4321 et seq.), the Council on Environmental Quality Regulations for Implementing the Procedural Provisions on NEPA (40CFR Parts 1500 -1508), and NASA's Procedures for Implementing NEPA (14CFR Subpart 1216.3), NASA has made a Finding of No Significant Impact (FONSI) with respect to the construction of a Neutral Buoyancy Laboratory (NBL) within the Assembly and Testing Building (ATB). The proposed action consists of construction of the NBL at the Sonny Carter Training Facility (SCTF) in Houston, Texas. The NBL is comprised of a large pool containing approximately 6 million gallons of water and associated equipment as well as additional space required to accommodate the test personnel and equipment. This facility will provide the required capacity for simulation of Space Transportation System (STS) and space station associated extravehicular activity (EVA) tasks. It is proposed to construct the NBL within the existing ATB located at 13000 Space Center Boulevard. This site is currently under lease/purchase arrangement between the NASA and its current owner, the McDonnell Douglas Corporation.

**DATE:** Comments in response to this notice must be received in writing by July 30 1995.

**ADDRESS:** Comments should be addressed to David Hickens, Environmental Services Office, NASA Lyndon B. Johnson Space Center, MS JJ12, 2101 NASA Road 1, Houston, Texas 77058.

The Environmental Assessment (EA) prepared for the construction of the NBL within the ATB at Houston, Texas, which supports this FONSI may be reviewed at:

Harris County Public Library, Freeman Memorial Branch, Reference Department, 16602  
Diana Lane, Houston, Tx 77062

NASA Information Center, Johnson Space Center, Houston, Tx

A limited number of copies of the EA are available by contacting David Hickens, Environmental Services Office, in writing at the address indicated.

**FOR FURTHER INFORMATION CONTACT:** David Hickens, Environmental Services Office, NASA Johnson Space Center, MS JJ12, 2101 NASA Road 1, Houston, Tx 77058, Telephone (713) 483-3120.

**SUPPLEMENTAL INFORMATION:**

NASA has reviewed the EA prepared for this project and has determined that it represents an accurate and adequate analysis of the scope and level of associated environmental impacts. The EA is incorporated by reference in this FONSI.

Two alternatives to the proposed action have been considered. One proposed action is construction of a completely new facility, including the building(s), at the Johnson Space Center (JSC) which would require more construction activities and longer completion period associated with higher cost. The other, is a no action alternative which would force NASA to continue training activities at scattered facilities which are too small to accommodate larger structural assemblies of the STS and the space station.

The potential cultural, socio-economic, biological, and ecological impacts anticipated from the construction and operations of the proposed NBL have been assessed and evaluated. Evaluation of each one of these issues did not reveal any significant impacts due to the proposed action hence a finding of no significant impact (FONSI) is determined. Cultural impacts were evaluated from the standpoint of land use, wild and scenic rivers, historical sites, and cultural resources. In the case of land use, a FONSI has been made as the only anticipated change will be the enhanced utilization of an existing building at the site. Also, no significant increase of the number of employees to operate the facility is anticipated. No evidence of historical sites, paleontological resources, artifacts, fossils, prehistoric settlement, wild and scenic rivers were observed at or in the vicinity of the site.

Socio-economic impacts from the standpoint of economic, population growth, and constructed facilities and activities again presented no significant impact to the surrounding areas and human environment. The only significant impact would be on NASA as this action will increase confidence that NBL will be constructed on schedule and important astronaut training can begin sooner. Also, additional savings from the early shutdown of JSC's existing underwater facility can be realized.

Evaluation of the biological and ecological impacts indicated no impact on biotic resources, wetlands or endangered species as the site is already developed and does not contain any critical habitats of plant and animal communities or wetlands. Liquid wastes consisting of backwash from the pool filtration system will be introduced into SCTF's sanitary sewer system. The anticipated wastewater flow will not pose any problem from the standpoint of handling and treatment. Any potential contamination associated with the wastewater will be mitigated by treating the water at Clear Lake Water Authority's wastewater treatment facility. Temporary and permanent dewatering system flow will be discharged into the storm water drainage system running along the east boundary of the subject site. No impact is anticipated from this action as no detectable levels of contaminants were found in the groundwater.

The proposed action was found to not have any adverse effects on the air emissions dispersion pattern near the proposed facility. The boiler for the proposed action will use natural gas as fuel and has a heat input rate of less than 25 million BTU's per hour. This boiler is therefore exempted from state permitting requirements since such equipment will not make a significant contribution to atmospheric pollution. Also, the normal operations of the NBL was found to generate relatively low noise levels as compared to average noise levels at the subject site generated by Ellington Field flight operations. Existing Ellington Field operations will have the dominant impact of noise levels in the site vicinity, consequently, the proposed facility will not increase noise levels considerably at the subject site and the surrounding areas. During the construction period of approximately one year and six months, increased vehicle traffic will be experienced along Clear Lake City Boulevard. An increase in noise caused by construction traffic will be the primary negative impact on the community. However, the anticipated impact on the nearby residential areas should be short-term and minimal. These short-term effects are offset by the relative long-term gains of providing a much needed facility for the JSC programs to accommodate larger structural assemblies required for the development of a manned space station.

On the basis of the Neutral Buoyancy Laboratory EA, NASA has determined that the potential cultural, socio-economic, biological, ecological and environmental impacts associated with this

project are found to be minimal and without significant individual or cumulative effect upon the quality of the environment. Therefore, an Environmental Impact Statement (EIS) is NOT required.
